Operational Pipeline from Client Data Intake to Physical Sheet Printing

Version 1.1.0 • System Documentation • Local Print Workflow

HYBRID ARCHITECTURE CONCEPT

IDexo splits operations for maximum performance: administrative work and customer data intake happen on the **Cloud SaaS Portal**, while heavy canvas rendering and high-res layout sheet PDF generation run natively in the **IDexo Desktop Client** on your printing press workstation.

Phase 1: Setup & Client Onboarding (Where to Start)

1

Card Template Configuration

Log in to the SaaS Portal and create a card template. Upload separate high-resolution background assets (300 DPI, standard CR-80 dimensions: 1013 x 638 pixels including a 3mm bleed margin). In the coordinate designer, map dynamic field boxes (Name, Grade, Roll Number, Profile Picture, and Barcode/QR values).

2

Generate Portal Share Link

Add the client profile under your Clients Directory. Generate a Secure Tokenized Share Link and share it with the client representative. The client does not need a username or password; the tokenized URL authenticates them automatically.

3

Client Data Upload

The client representative uploads their cardholder roster spreadsheet (Excel/CSV) and an archive folder (ZIP) containing student photos named after their unique identifier (e.g. roll_number.jpg).

Phase 2: Roster & Photo Validation

1

Automated Roster Review

Open the order detail page and verify the roster grid. Look for warning flags highlighted by the system, such as missing photos, text inputs exceeding coordinate boundaries, or duplicate roll numbers.

2

Direct Detail Correction

Correct minor data errors (spelling typos, admission ID digit corrections, or custom fields) directly from the dashboard grid on-the-fly to avoid requesting full roster updates from the client.

Phase 3: Client Layout Approval Cycle

1

Automate Approval proofs

Transition the order status from **Draft** to **Approval Sent** using the Workflow Controller. The platform automatically queues and compiles a watermarked A4 proof sheet containing multiple student cards for layout verification.

2

Share Proof Link

Use the "Share Proofs Link" button in the Layout panel to copy a pre-formatted message and send the proof sheets directly to the client via WhatsApp or Email.

3

Confirm Layout Sign-off

Once the client reviews the proof sheet and signs off on layouts and spelling, click the "Approve Layout" action. The order status updates to **Approved**, unlocking final high-resolution sheet compilation.

Phase 4: Print Production & Finishing

1

Start Production compilation

Transition status to **Printing Press**. This deducts credits (10 credits per single-sided card, 15 credits per double-sided card) and queues the high-resolution grid compilation.

2

Local Compilation Execution

Open the IDexo Desktop client on the local workstation. It polls the server queue and renders the print layout sheets (e.g. A3/SRA3) with a horizontal mirroring algorithm. This mirrors the back-side grid relative to the front-side grid, ensuring perfect alignment when sheets are folded back-to-back.

3

Duplex Printing & Cutting

Fetch the compiled PDF from your local Documents/idexo_prints/ folder. Print the sheets duplex. Fold the sheet along the printed guide lines to confirm front-to-back alignment, then trim along outer crop mark hairpins to separate individual cards.

Phase 5: Delivery & Local Data Retention (Where to End)

1

Mark Order Delivered

Package and deliver the physical cards to the client. Mark the order as **Delivered** in the Workflow Controller, which automatically triggers the compile of the billing invoice PDF.

2

Automated Local Archiving & Purging

On the 15th of each month, the system runs local background maintenance. It downloads cardholder details and high-resolution photo assets from the second-to-last month, archives them to a ZIP backup folder on the local machine (Documents folder), and permanently deletes old roster records and Cloudinary images to secure student data privacy.

Operator Operational Checklist

- ☐ Verify card template coordinates and dynamic text boundaries.
- ☐ Confirm no warnings or missing photos exist on the roster table.
- ☐ Verify client layout approval before initiating production compilation.
- ☐ Run the Electron desktop client to compile high-resolution PDF print grids.
- ☐ Perform double-sided alignment check along the center fold lines.
- ☐ Confirm local ZIP backup matches historical database records before monthly purges.
